Seismic Transition Covers™

Many parking structures require gaps in the concrete to allow for seismic shifting. **Seismic Transition Covers™** are auto traffic bearing expansion joint covers for any structure that requires transitioning from one independent structure to another. **SafePath™ Products** provide the solution to the current noisy metal ramp covers. **SafePath™** introduces an architecturally designed transition system to accept tire impact that is quiet, solid, and safe.

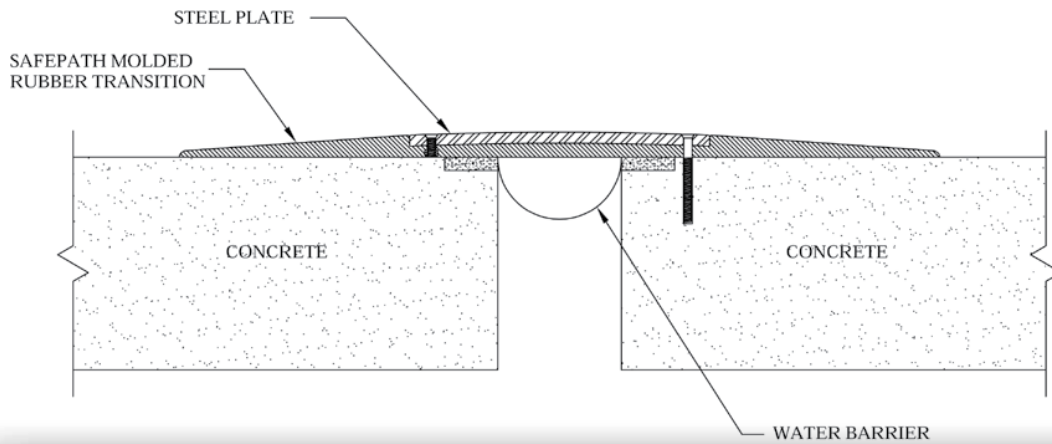

Surface Mount Seismic Cover System

The design includes an embedded steel load-bearing slide plate for maximum support and load limit. The slide plate is coated with a specifically designed UV stable and high SCOF rating creating a non-slip surface. **Seismic Transition Covers™** resist the damaging effects of weather and can accommodate heavy traffic.
